

## The Power to Innovate

Powerline expansion demands the best solution, not necessarily the one you asked for. When selecting a service provider, it's important to choose someone that can look beyond what's being asked to completely rethink the problem and put forward a safe, innovative and cost-effective solution.

When SaskPower needed to replace and relocate several transmission structures within a very limited time frame, they initially proposed the construction of a temporary bypass to complete the work in a de-energized state. Thanks to our wide breadth of expertise and experience in energized work and barehand techniques, Allteck was able to propose an innovative solution to SaskPower, and the results speak for themselves:

- // **25% Reduction in Project Cost**
- // **40% Reduction in Construction Time**

Innovative solutions like this is how we build and maintain strong relationships with our valued clients like SaskPower.

We open new possibilities to our clients while advancing the state of the art of powerline installation and maintenance.
